Categories You are viewing the archive of "7-Data Recovery Suite Crack With Serial Key Free Download".Q: Windows service not starting on server reboot I have a windows service that is being called from another application via WCF services. This is working well on my dev machine. However I am struggling to get this to work on the server. I have created a log file in the service directory, and have set this to be called in a service installer event (the installer is not present on the server). I have enabled log file tracing in the project properties for the service, and the service start up script executes but the log file is not created. I have also tried logging via a test application, and the logs are not created. I have ensured that the service config file is set to start with system, it is being set to start as well as the installer event. Can anyone think of anything else I can try? Thank you for any suggestions. A: You probably have to make your service 'trusted' when it's set to run as a service. Open the "Services" Control Panel Select the service, and click "Properties" Click the "Log On" tab Click the "Change Account..." button Change the account so you have access to the logs. If you're not logged in as the service account it won't be able to write to the log file. A: I found a solution that works for me. In the service's installerscript event handler I had a code like this  
InstallUtil.AddUserService("MyServiceName", true, ServiceProcessInstallerAction.Start) However, the adduserservice method is not documented by the installerscript. After contacting the .net team, I have

---

found out that: `InstallUtil.AddUserService` returns true if the user had been added to the list of users. So, the correct code should be: `InstallUtil.AddUserService("MyServiceName", true, ServiceProcessInstallerAction.Start)` Also, `InstallUtil. 2d92ce491b`
