Field of the Invention The invention relates to the field of pipette dispensers for the dispensing of fluids, and more particularly to a device for removing material from a tube. 2. Description of the Prior Art Hand-held pipettes are commonly used for the dispensing of liquids from tubes. The tip of the pipette, when used to dispense liquid, is dipped into the tube and the plunger of the pipette is pushed by hand to urge the liquid through the tip. The tip of the pipette is then moved from the liquid tube to an area where the pipette tip is out of the liquid. The pipette tip may then be wiped off against a paper towel to remove the liquid from the tip. The hand-held pipette makes it easy to obtain a precise amount of liquid from the tube. In addition, there is less chance of spilling liquid when a hand is not in contact with the tube. While hand-held pipettes are an improvement over the common syringe, problems can occur when the liquid is spilled. Often the liquid droplets from the spill are not easily removed. Further, if a great deal of liquid is spilled, an excessive amount of material may be removed from the tube and wasted. In addition, time is lost while removing liquid from the tube using the hand-held pipette. A number of prior art dispensing devices have been developed to overcome the problems of prior art devices. U.S. Pat. No. 4,875,810 to Dalpiaz, for example, discloses a device for forcing liquid out of a tube through a valve. U.S. Pat. No. 4,952,236 to Flansburg, et al., describes a syringe to dispense material by pressurizing material above a piston. U.S. Pat. No. 5,123,424 to Adams discloses a dispenser that uses a piston to force liquids out of a syringe. While these devices work well for their intended purpose, the devices are difficult to use. For example, the device to 3ef4e8ef8d
