Basic Principles and Functions of the Human Body Basic Principles and Functions of the Human Body The human body is the most complex of all living organisms, and its complex physiology is the basis for all human activity. 1. Functions of the Nervous System The nervous system is the central organ of the body. It is made up of the brain and spinal cord. This system is the means by which the organism controls all muscular activity, senses and learns. 2. Central Nervous System (Brain and Spinal Cord) The central nervous system (CNS) consists of the brain and spinal cord. The brain processes and stores information and controls most actions. The spinal cord is a group of nerve cells that transmit information throughout the body, and to the brain. 3. Sensory Nervous System The sensory nervous system is responsible for all sensations of the body, such as pain, temperature, light, pressure and other mechanical stimuli. 4. Specific Nervous System The specific nervous system is responsible for performing functions for specific body systems, and is composed of sensory neurons that receive information from the sensory organs, transmit information to the brain, and motor neurons that transmit information to the muscles. 5. Peripheral Nervous System The peripheral nervous system is made up of the somatic and autonomic divisions. The somatic nervous system is composed of the somatic motor and sensory neurons, which perform functions related to voluntary movement (eg, speaking, holding fist), balance (eg, movement of eyes) and sensation. 6. Autonomic Nervous System The autonomic nervous system controls the body's involuntary functions, such as respiration, digestion, perspiration and heart rate. 7. Reflex Nervous System The reflex nervous system is responsible for the immediate physiological responses
