Crack. The present invention relates to generators and, more particularly, to a system, method and apparatus for adjusting the voltage generated by a generator which compensates for imbalance in the generator armature due to a variable exciter field. U.S. Pat. No. 5,035,441 to Bryant discloses a two-pole exciter for a generator in which the exciter field poles are connected to an exciter frame. One of the generator field poles is connected to the center of the exciter frame, and one of the generator field poles is connected to one side of the exciter frame. The armature field poles are connected to the opposite side of the exciter frame. A coil winding is mounted on the sides of the exciter frame, and a second coil winding is mounted on the center of the exciter

---

frame. The coils windings extend through the holes of the exciter frame. A current is established in one of the exciter field poles, thereby generating a magnetic field in the exciter frame that is symmetric about the center of the frame. The magnetic field produced by the exciter frame and the armature field poles counteracts the magnetic field produced by the generator field poles and generates an opposing magnetic field. The counteracting magnetic fields produce a rotary motion that is transmitted to the center of the exciter frame via the frame bolts that extend through the exciter frame and the frame braces. A plurality of shims (adjustable spacers) are mounted on the frame bolts and function to adjust the location of the frame

---

braces, thereby adjusting the location of the center of the exciter frame. The shims are adjusted to move the center of the exciter frame to a desired location. The generator is thus moved to a position that results in the desired output voltage. This method may be used to adjust the output voltage of an electric generator. The system compensates for any imbalances that may exist in the generator. This method does not compensate for the polarity of the exciter field. U.S. Pat. No. 4,947,744 to Myers discloses a generator control system that includes an electronic control module. A voltage sensor is connected to the output of the generator and provides a voltage signal to the control module. An exciter field voltage is provided from the control

---

module to
